Physical Security

There are 2 major components of Physical Security; Video Security and Access Control.

Many companies overlook the importance of Physical Security related to Compliance for HIPAA, HITECH, and PCI. Do you have this hole in your compliance efforts?

Or, do you need to have Physical Security for another reason such as protecting valuable equipment or inventory, or keeping watch around your building or parking lot?

Having video to go with an electronic log when a security event occurs removes any doubt about who was using a device or who entered the area. Someone can login to a computer using another user's login but the camera shows the image of who was there.

Limiting access to your facility increases your security level. Restricting employee access to specific areas can further enhance the security of sensitive areas such as Drug Storage, Server Rooms, or PHI Storage areas. Further restricting after-hours access prevents unauthorized personnel from coming to the office when no one is around to see what they are doing.

By combining Video Security with Access Control you will greatly enhance your Physical Security. MicroServe Consulting's Engineers can design, implement, and maintain your complete Video Security and Access Control systems.

Video Security and Access Control systems are really just network devices so they must work with your existing network. MicroServe's engineers utilize our network architecture expertise so our solutions are customized to work seamlessly within your IT infrastructure and environment.

We adhere to industry recognized best practices as we plan and create custom solutions that meet your requirements today and into the future.

Call us today at (240) 686-2012 for a free Physical Security consultation.
